

Quick Insights for Big Mart Sales Analysis Project

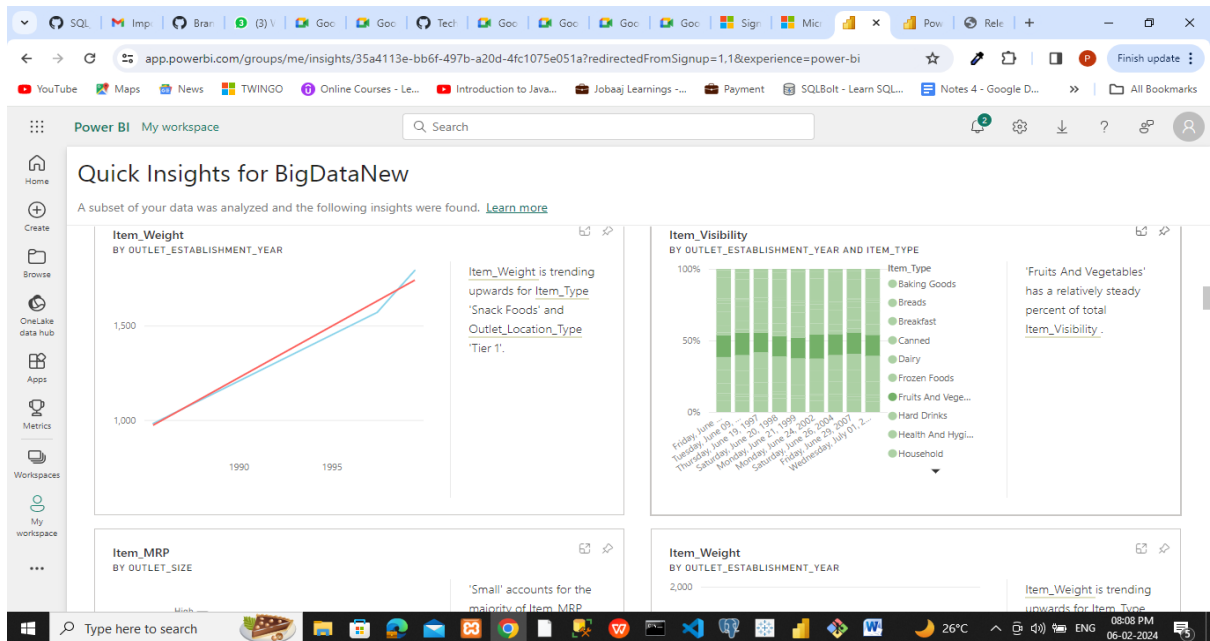

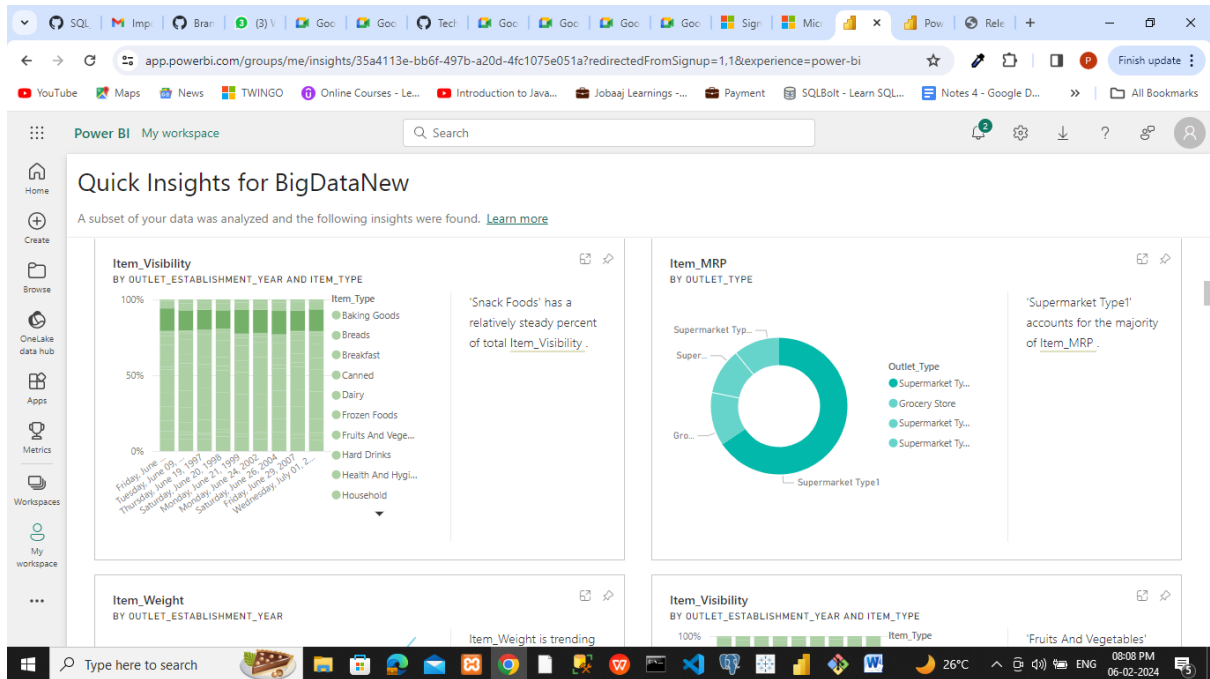

1. Data Cleaning:-

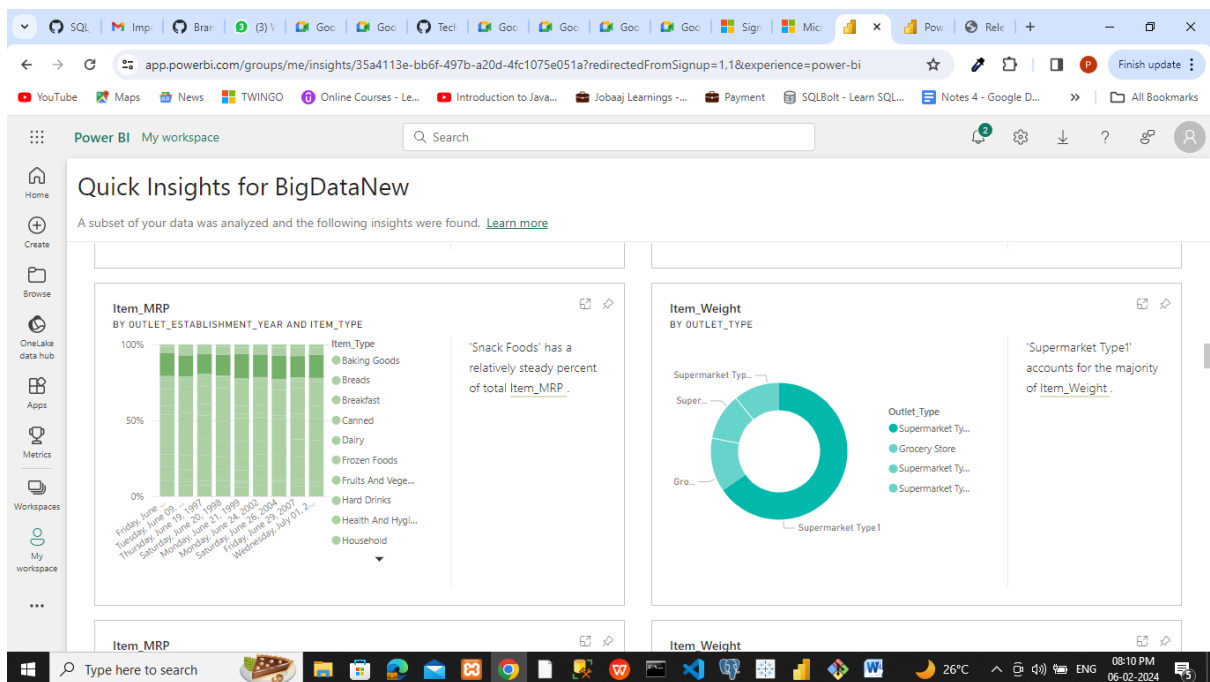

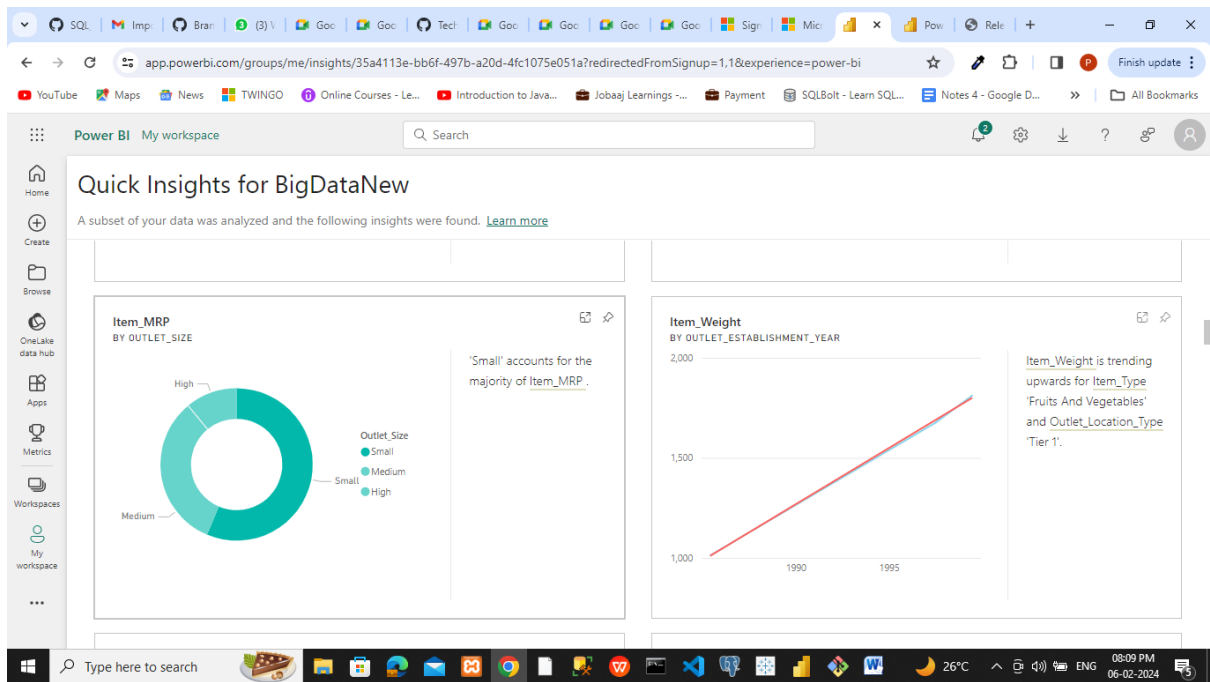

- First we import the data in the excel by clicking the data tab and selects get data.
- Then we identify the missing and null values and filter them or by using formula for mean and mode according to situations.
- Then we should check the duplicate data and if finds then we have to remove that by right click in the column and select remove duplicate values.
- Also we check the outliers by finding the mean and average values for the particular numerical columns.
- The main thing is to check the data type and those conversions. We can change the data type according to the column values.
- We have to add the column and do calculations for finding the month according to year for better insights for our project.

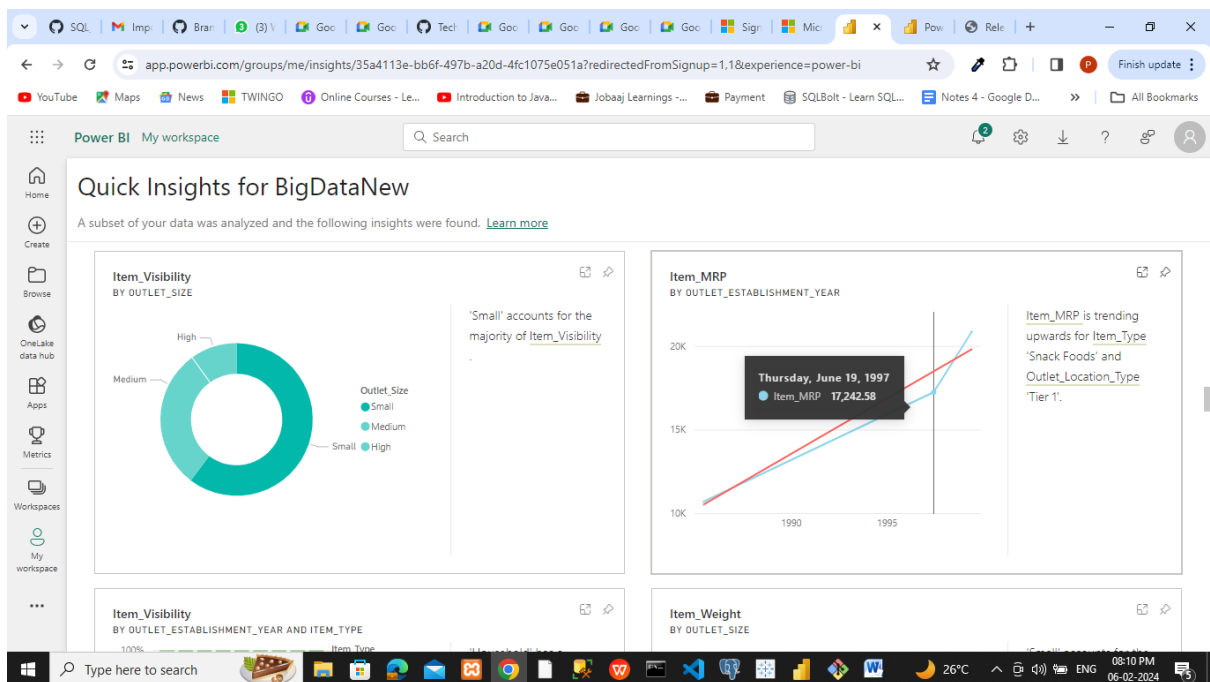

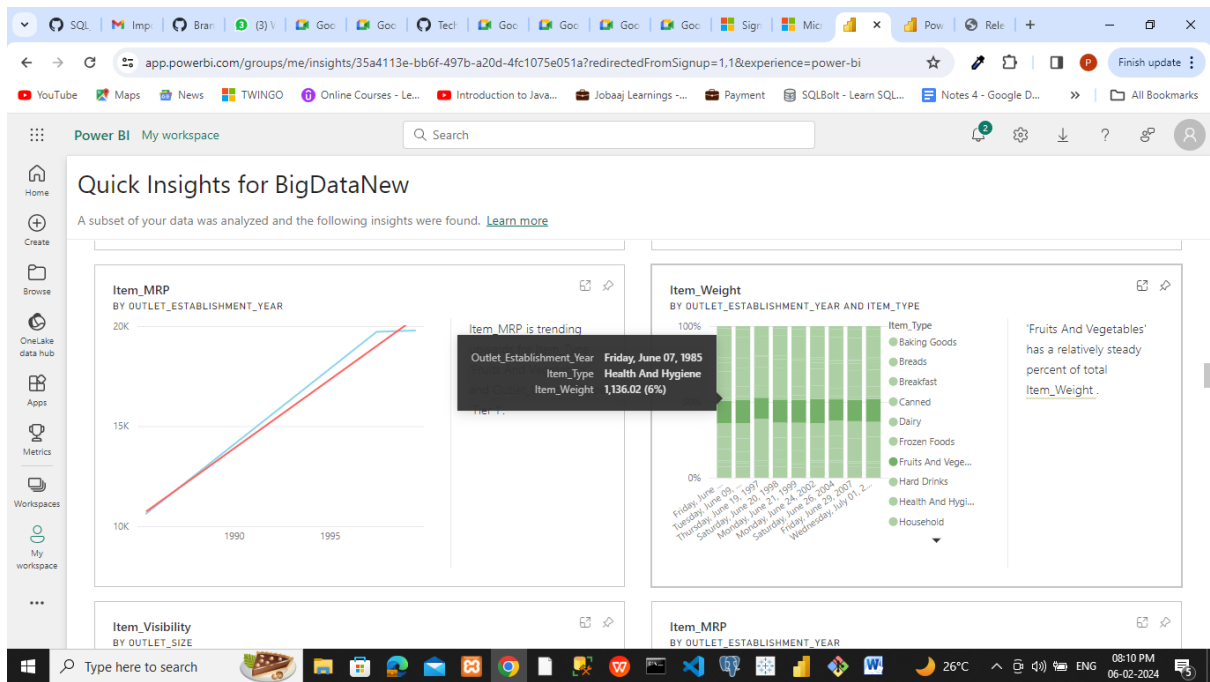

2. Build the Dashboard Using PowerBI:-

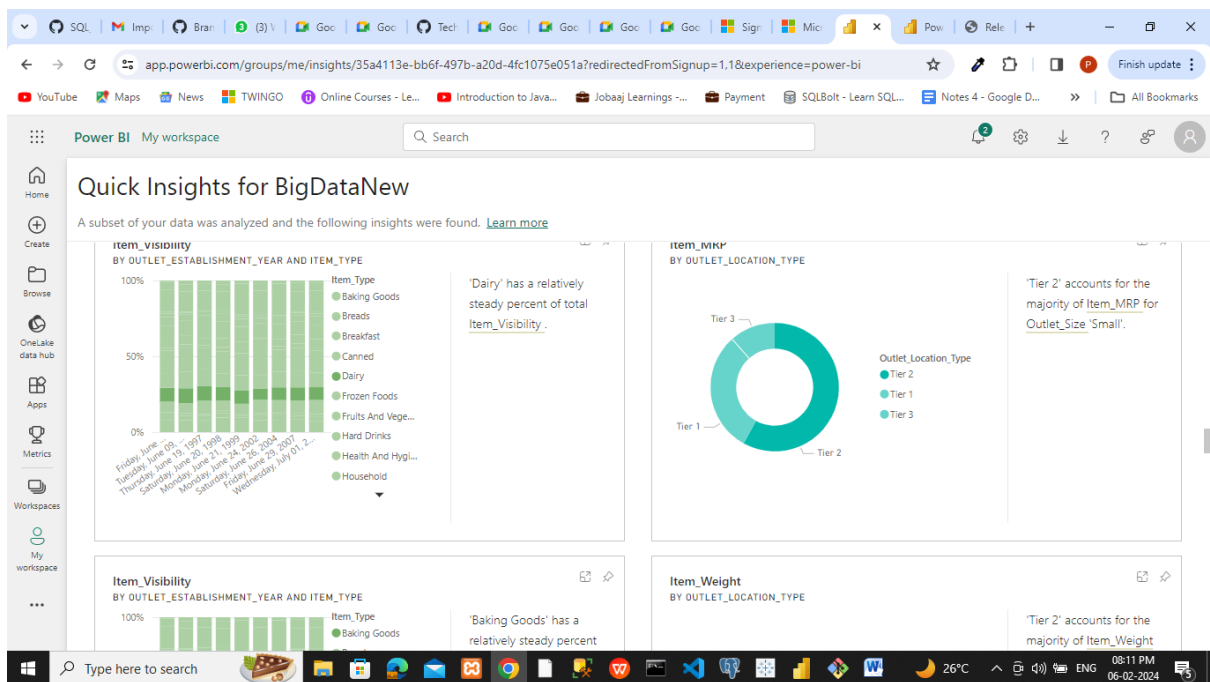

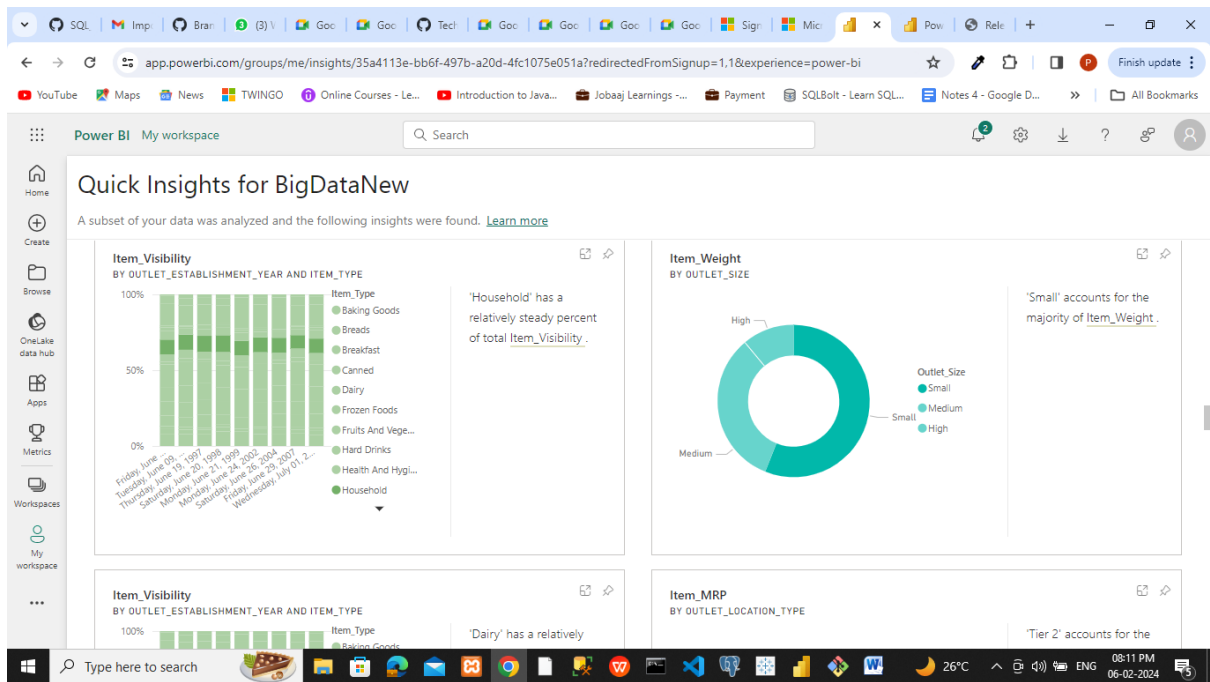

In this project some of the visual tools are used for summarizing the sales insights for the Big Market Analysis.

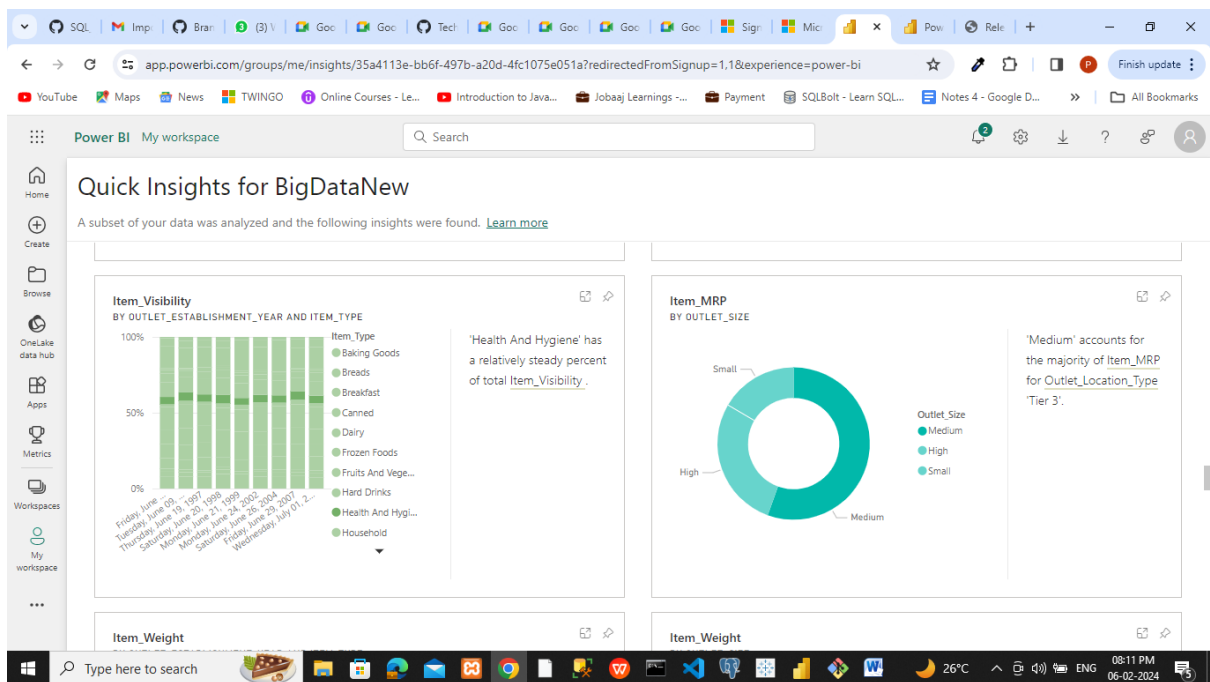

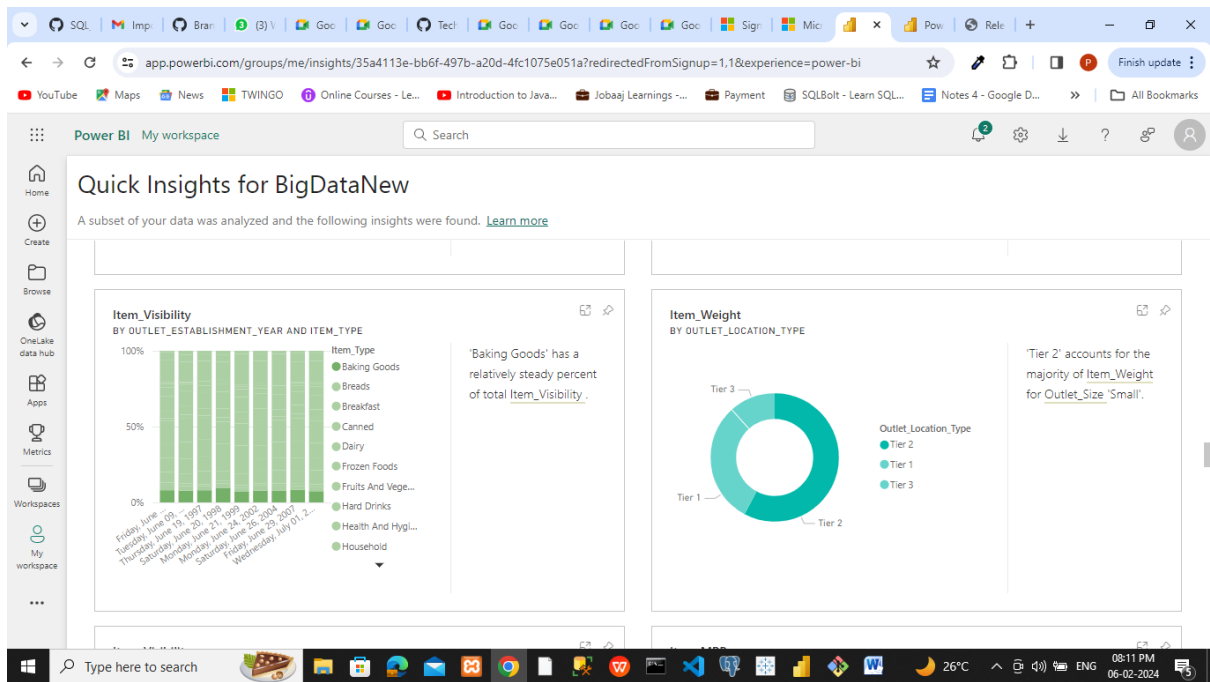

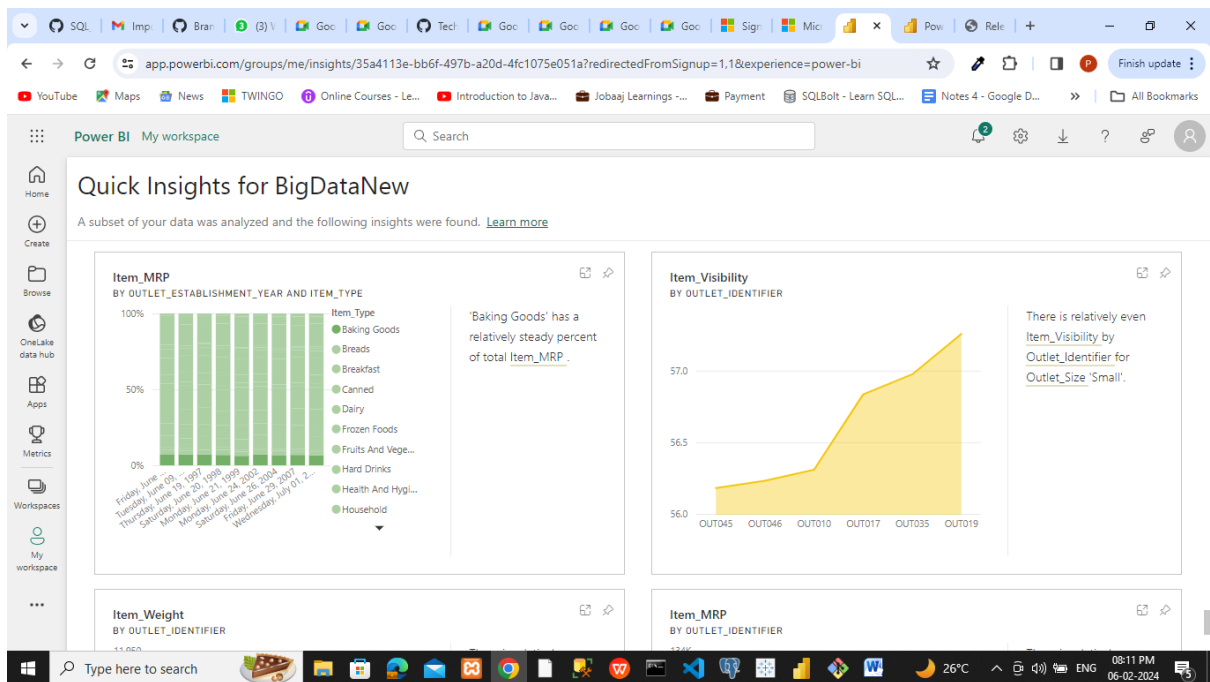

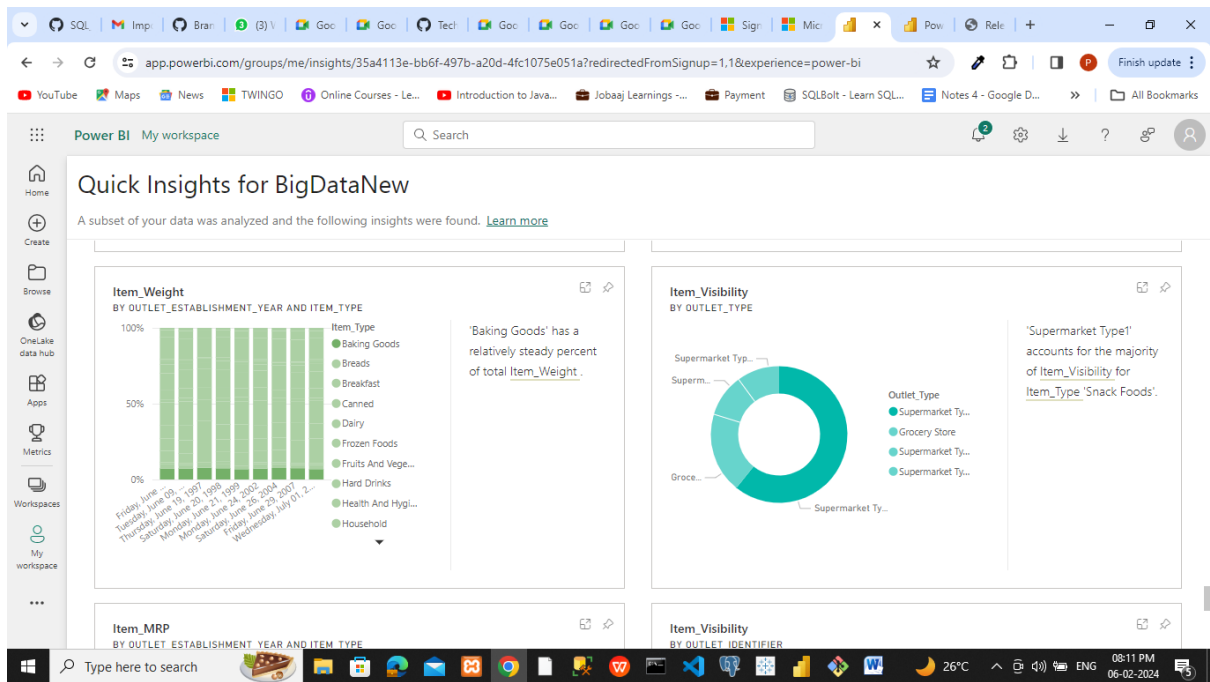

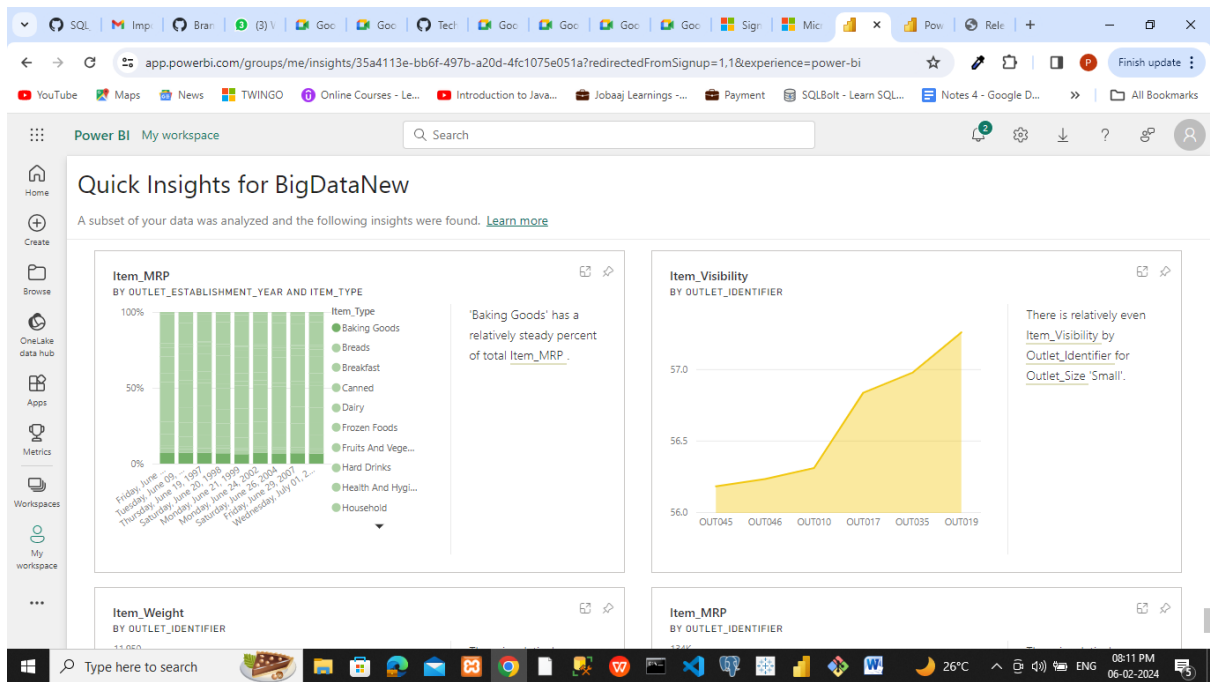

Final Dashboard-
